

EH-Plot – Data Visualization

This R function provides a convenient way to visualize the distribution of grouped numerical data. Instead of just using boxplots some people prefer to display data as in the figure above, where data points are drawn next to each other ("dispersed") if they are almost equal. However, we did not find an R function that produces such plots. It even seems that there is no name for this kind of data visualization. With the R code below one can easily create what we call an "EH-Plot".
